

**FIRE EXTINGUISHER WITH MEANS FOR  
PREVENTING FREEZING AT OUTLET**

Abstract of the Disclosure

5 A method and an apparatus for preventing freezing at the outlet of a fire  
extinguisher are disclosed. Moisture in the fire extinguisher fluid is removed by  
contacting the fluid in the fire extinguisher bottle with a desiccant such as molecular  
sieve 3A. After the fluid in the extinguisher has been in contact with the desiccant for a  
week, the moisture level is about 5 ppm, well below the 40 ppm which causes freezeup  
at the outlet. The desiccant is preferably placed inside a metal screen tube having metal  
10 wire loops extending from the sides of the mesh tube. The wire loops keep the mesh  
tube away from the outlet so that flow restriction will not occur. The wire loops also  
protect the desiccant from being damaged when the fire extinguisher is discharged and  
provide a handle which can be used to pull the metal screen tube out of the bottle during  
refurbishment.
